

Secondary Osteoporosis

- Endocrine diseases
- Gastrointestinal disorders
- Hematologic diseases
- Rheumatological diseases
- Drug-induced osteoporosis
- other causes...

„... a systemic skeletal disease with reduced bone mass *and* impaired micro-architecture of the bone tissue leading to increased fragility and fracture risk.“

Consensus Conf 1993

Bone remodeling

Bone formation and resorption

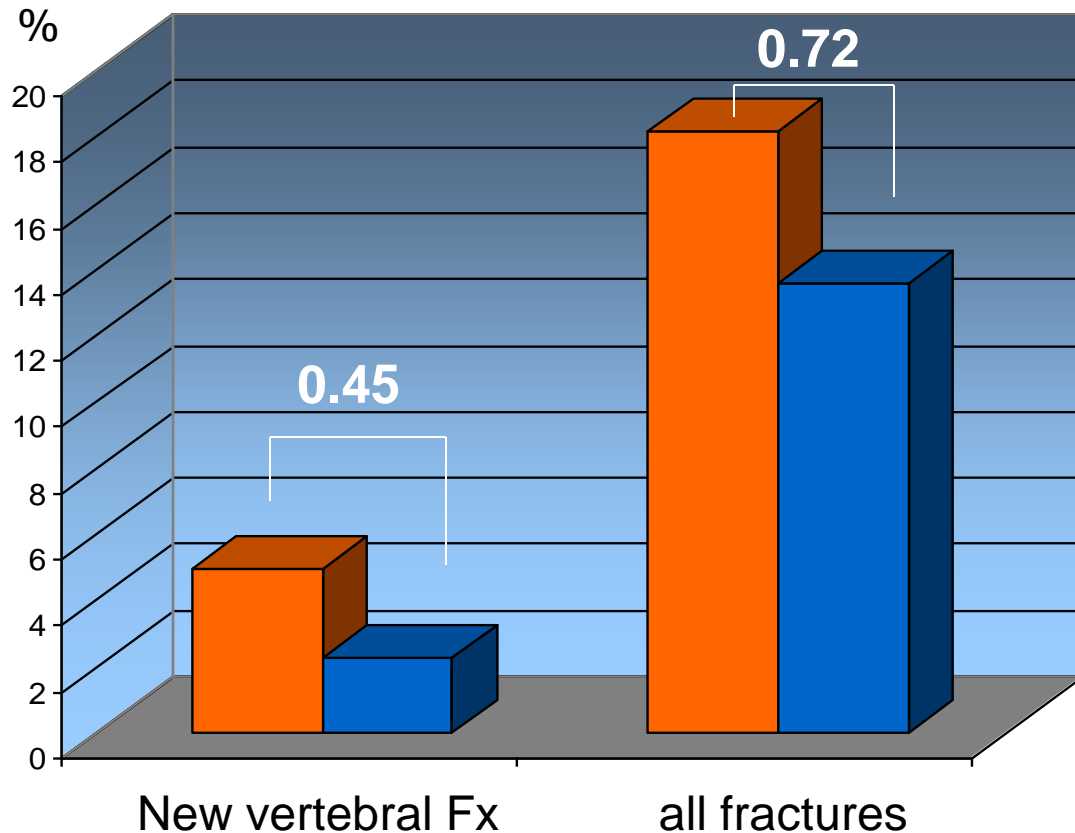

Radiological Dx
Vertebral body-Fx
= -20%/4mm

FIT

Lancet 1996;348;1545-

2027 women 55-81y over 3 years

Placebo vs **Alendronat 10mg**

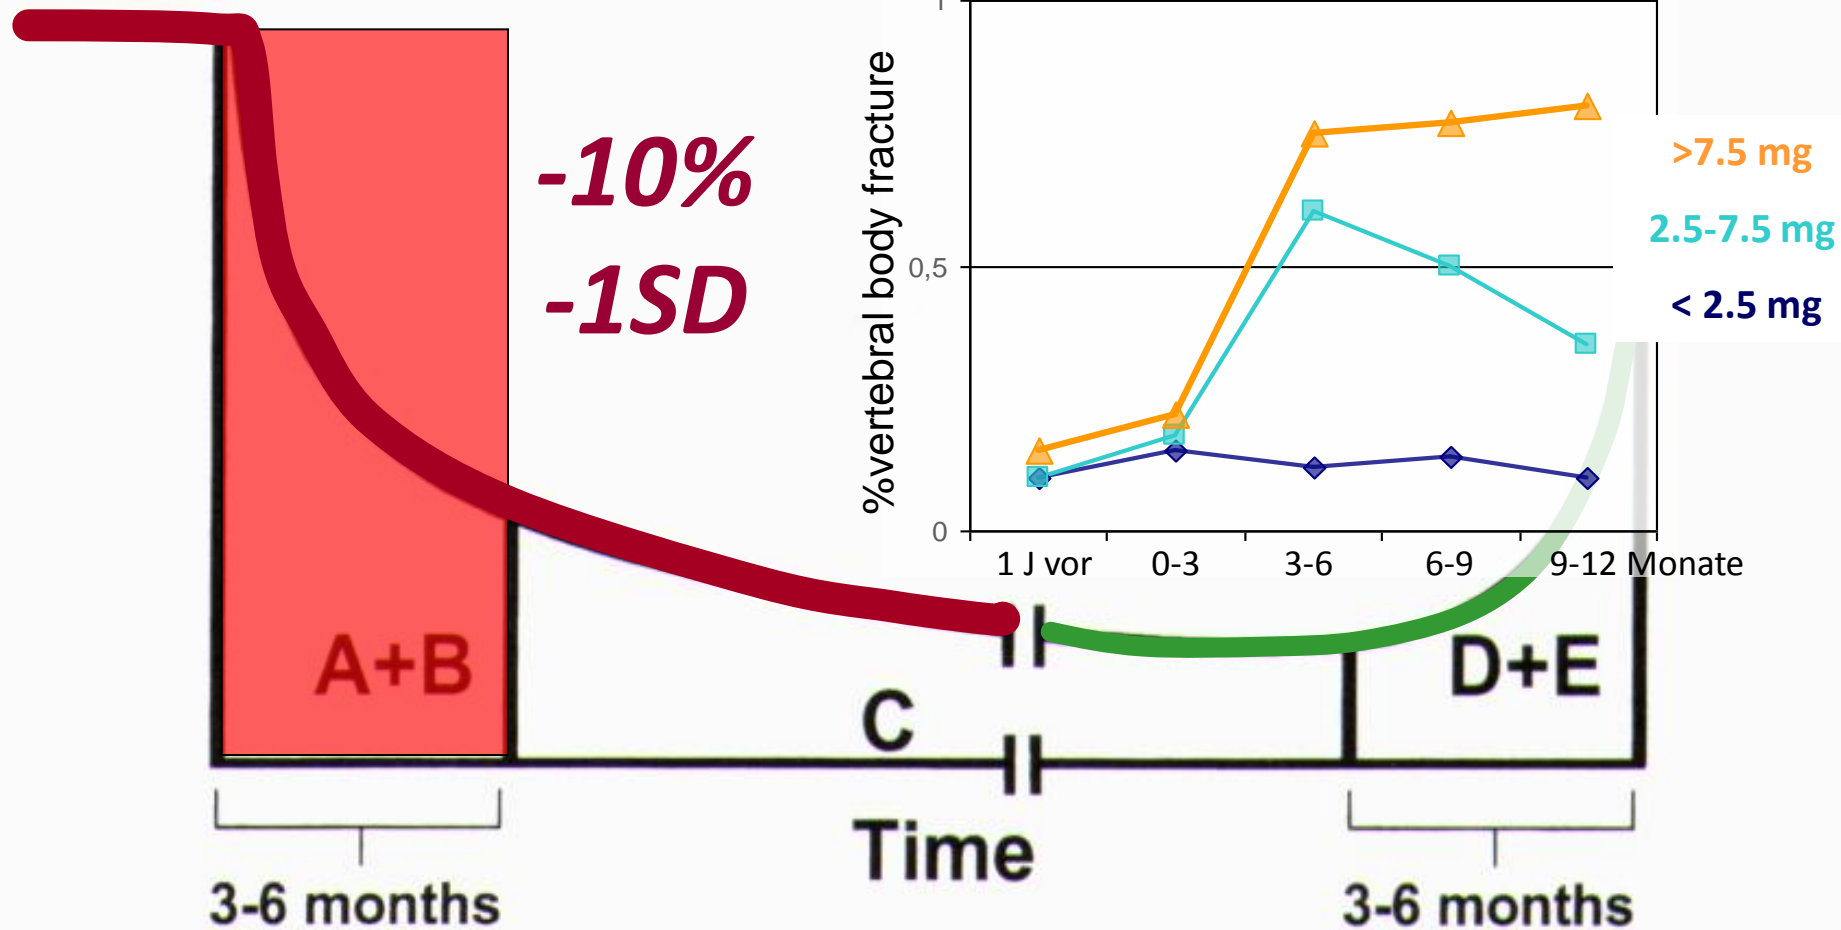

Summary

1. Bone strength is determined by bone density and architecture.
2. Bone formation < resorption = osteoporosis
3. Estimation of fracture risk = DXA *and* risk factors
4. Secondary causes in up to 30% of female and 60% of male osteoporosis.
5. Bisphosphonates reduce fracture risk by 25% to 50%.

Glucocorticoid-induced osteoporosis (GIOP) and myopathy

Loss of bone mineral density under treatment with glucocorticoids

Frequency and predictors of osteoporotic fractures after transplantation *Lancet 2001;357;342-*

235 Organ-Tx →
105 heart transpl.
130 liver transpl.

*Osteoporotic fractures
1, 2 and 4 years after
transplantation*

Risk factors:

Age 1.71/5y

BMD 1.97/SD

Vert Fx **6.07**

*„...a neglected
problem...“ P Delmas*

Treatment with Prednisolon ≥ 5 mg > 3 months

atraumatic fx or high risk

yes

no

T-Score < -1.5?

yes

no

Ca²⁺ 1000mg
Vit D3 1000/2000 IE
Risk factors
**Bisphosphonates or
Teriparatide (Forsteo®)**
+ additional Tx

Ca²⁺ and Vitamin D3

Repeat BMD
after 1 Jahr

Summary

1. 50% of patients on long-term glucocorticoids will suffer fragility fractures.
2. 10% of bone is lost in the first 6 months of GC treatment.
3. Preventive pharmacological treatment is indicated when there are fragility fractures or T-Score <1.5.
4. GC-induced myopathy and avascular necrosis.

Drug-induced osteoporosis

Glucocorticoids

Aromatase inhibitors (Arimidex[®], Femara[®])

GnRH agonists (Zoladex[®])

Cyclosporine A

Thiazolidinediones (Avandia[®], Actos[®])

Anticonvulsants (Depakine[®], Phenytoin)

Heparine

Antidepressants (SSRI)

PPI (Omeprazol, Pantoprazol)

...

- Admitted because of „deterioration of general health“
- 1999 femoral neck fracture, 2003 myocardial infarction, 2005 pneumonia
- BP 134/76, P 88/min, 167cm (-12cm), 75 kg, no body hair, gynecomastia +/+, testicular volumen <3ml

Prevalent vertebral deformities predict hip fractures and new vertebral deformities

Black et al, *J Bone Miner Res* 1999;5:821

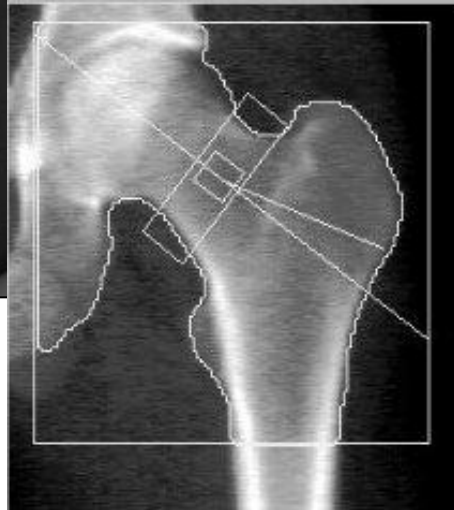

Panneman MJM et al, *Osteoporos Int* 2004;15:120

1199 males with hypogonadism and osteoporosis

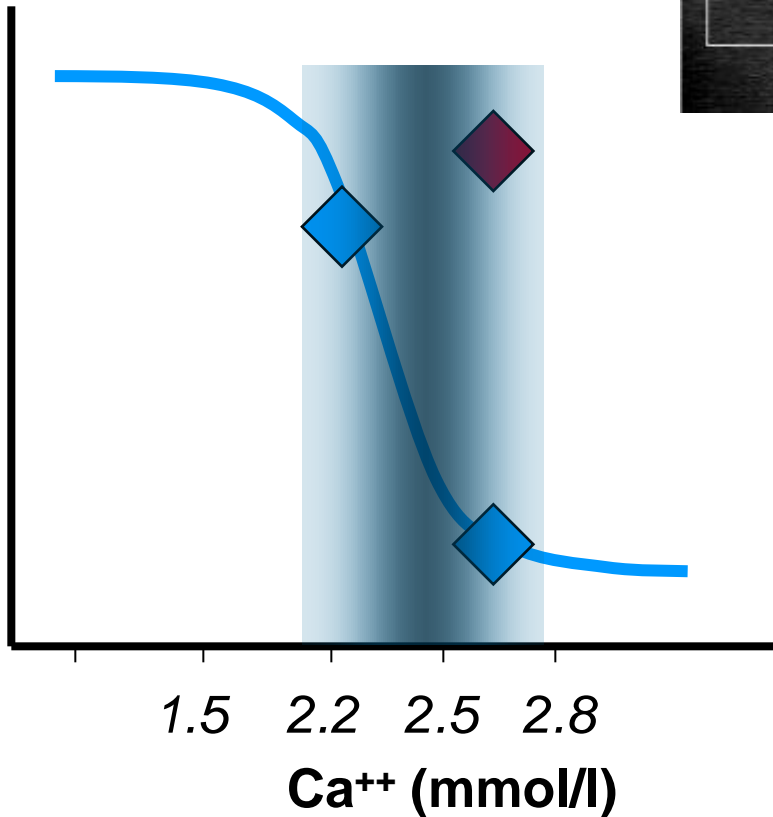

Osteopenia/porosis of cortical bone

PTH

Parathyroid hormone

Mr S.W., 1976

Fatigue, diffuse Arthralgias

Ca²⁺ 2.69 (N 2.1 - 2.6)

Phosph 0.7 (N 0.9 - 1.5)

PTH 59 (N 13 - 65)

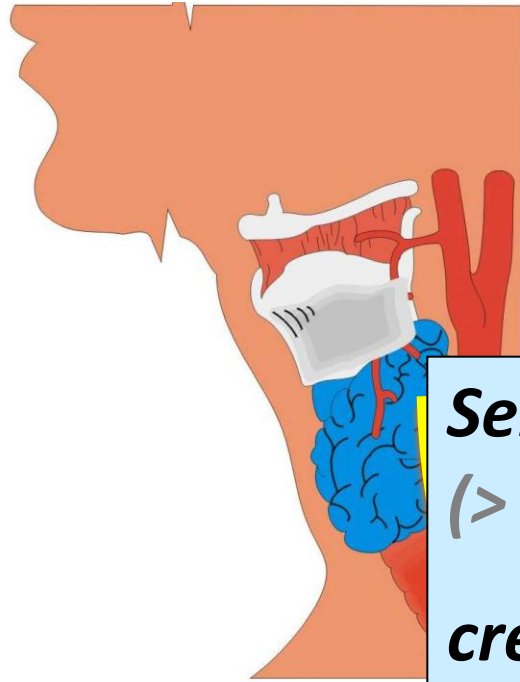

nephrolithiasis 15%
acute pancreatitis 5%

;-Wert: 247
N/C: 4451/2359
Kantonsspital Luzern

Calcium

***Serum calcium >0.25 mmol/l (>1mg/dl) UNL
(> 3 mmol/l [>12mg/dl])***

creatinine clearance < 60 ml/min

reduced creatinine clearance > 30%

T-score < -2.5 SD (or previous fracture)

age < 50 y

hypercalciuria > 100 mmol/24h

hypercalcaemic crisis

JCEM 2009;94:335-

Phosphate ▼ HCO_3^-

Mrs W. O., 1952

Diabetes mellitus type 1

Early menopause 38 y

Diffuse arthralgias,
particularly of finger joints

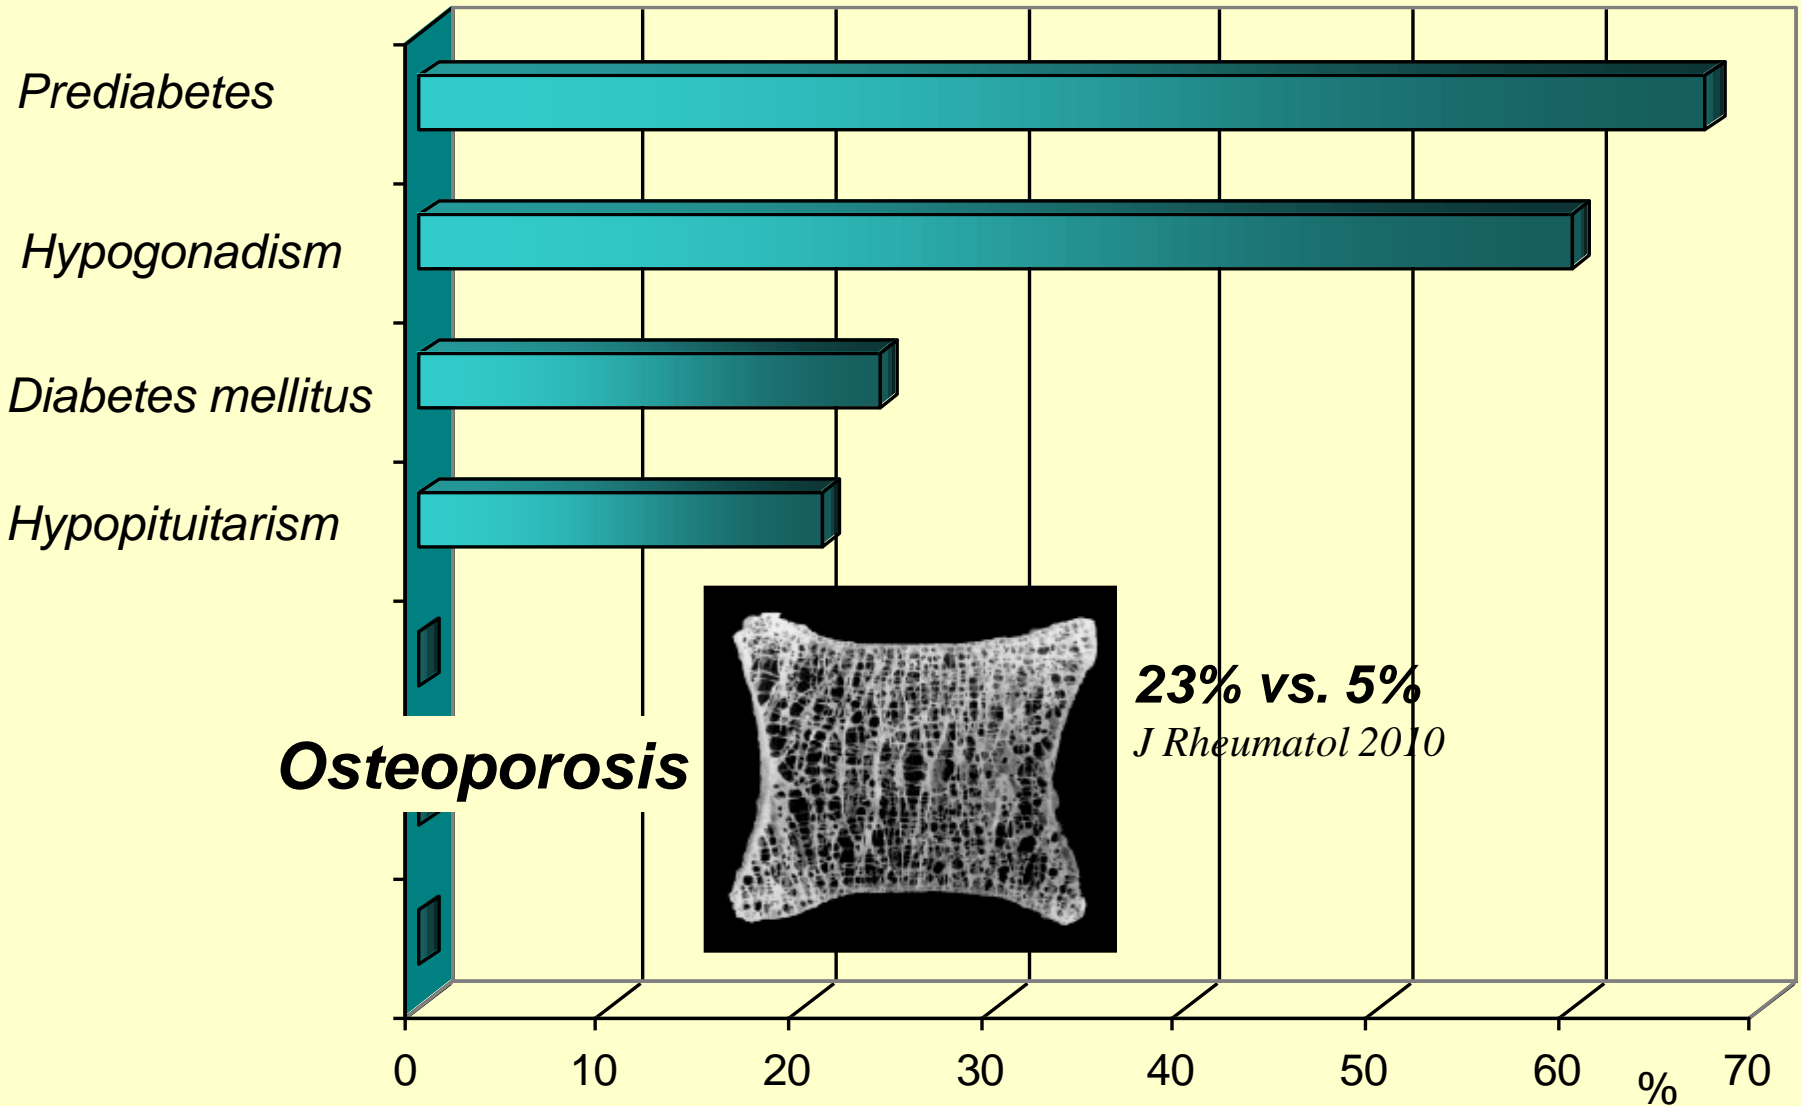

FSH < 0.1 IU/l
Estradiol < 180 pmol/l
TSH 1.2 mU/l
fT4 5.6 pmol/l
Cortisol 191 nmol/l

ALAT: 88 U/l (n <40)
ferritin: 567 mcg/l (n 30-300)
transferrin saturation: 54%
HFE: homozygous C282Y

Hemochromatosis and endocrine diseases

Transfusion 2010, Thyroid 2008, J Endocr Invest 1999, Acta Clin 1999, Osteop Int 1996, JCEM 1993, Ann Int Med 1989.

Mrs T.H., 1951

Laboratory findings:

HbA1c **9.7%** (3.0-6.0)

Calcium **2.26** (2.1-2.7)

Ferritin **7** (30-300)

sTR **5.9**

TSH **2.5** (0.2-4.2)

Hb **10.1** (11.5-15.5)

MCV **80** (80-100)

T-Score (femoral): **-3.1**

Polyglandular autoimmune syndrome

PGAS type I

*AIRE chrs 21
candidiasis
hypoparathyroidism*

PGAS type II

*HLA-DR associated
"pansteroid" cell
antibodies (Schmidt)*

PGAS type III

*associated with rA,
myasthenia, celiac
disease, pbc...*

Clinical findings

Iron deficiency, folic acid deficiency

Diarrhea, "irritable bowel syndrome", aphthous stomatitis

Osteoporosis / osteomalacia, arthralgia

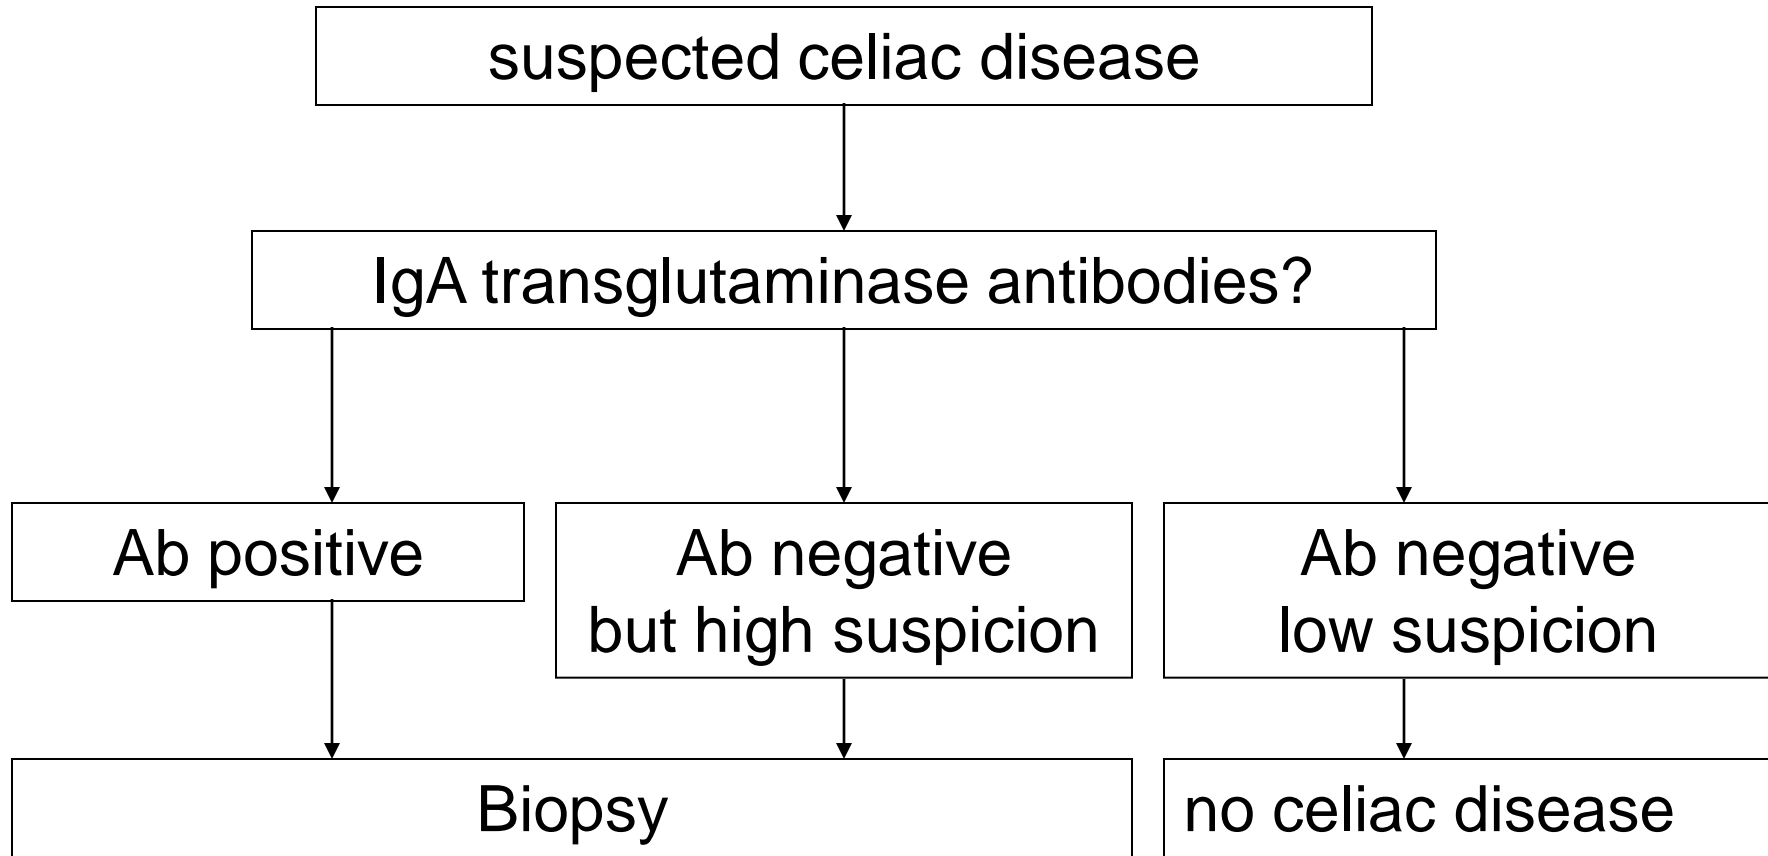

Chronic fatigue syndrome, depression

Vitamin K deficiency, thrombocytosis, "transaminitis"

Recurrent miscarriages, infertility (4-8%)

Polyneuropathy, ataxia, "unexplained" neurological findings...

Celiac disease: diagnosis

positive biopsy and negative Ab
→ differential diagnosis!
→ IgA deficiency?

Celiac disease: treatment

Gluten-free diet

No wheat, rye and barley (oat) gluten

avoid lactose (at baseline)

supplementation of iron, folic acid and calcium

CAVE "gluten contamination"

no beer

wine, spirits and liquor permitted

(malabsorption: parenteral medication!)

Summary

1. Common cause of osteoporosis I:
hypogonadism (e.g. Klinefelter 1:500)
2. Common cause of osteoporosis II:
hyperparathyroidism (of cortical bone)
3. Common cause of osteoporosis III:
hemochromatosis (beaks)
4. Common cause of osteoporosis IV:
malabsorption syndromes (celiac disease, IBD,
after gastric-bypass surgery...)

Summary II

5. Rare causes of osteoporosis:
osteogenesis imperfecta (blue sclerae),
multiple myeloma, mastocytosis...
